# **Executive Summary**

This document shows the design and implementation of the game, Super Smash Brothers. This is a way to see all the different relationships throughout the game. The document will give an ER diagram along with create statements for all the different tables. It will also show an implementation of views, store procedures, reports, and triggers.

The purpose of this database is the show the different relationships between all the aspects of the game. This could be useful for generating reports and statistics about the game. The main goal of this document is to design and implement a third normal form database (or even better codd normal form).

# **Entity-Relationship Diagram**

## **Create Table Statements**

### **Players Table:**

The players table represents the users who are playing the game. Each player has their own player id (pid)

```
--Players Table--
CREATE TABLE Players (
             CHAR(4) UNIQUE NOT NULL,
  pid
             TEXT NOT NULL.
  userName
             VARCHAR(20) NOT NULL,
  password
  firstName
             TEXT,
  lastName
             TEXT,
  dob
             DATE
                    NOT NULL,
  favCharacter TEXT,
             TEXT,
  favStage
 PRIMARY KEY (pid)
);
```

### **Functional Dependencies**

pid —> userName, password, firstName, lastName, dob, favCharacter, favStage

### **Sample Data**

Data	Output E	cplain Messa	iges History					
	pid character(4)	username text	password character varying(20)	firstname text	lastname text	dob date	favcharacter text	favstage text
1	p000	FrankBond007	IamAwesome	Frank	Siderio	1996-02-19	Pikachu	Final Destination
2	p001	baseballDude	tgife@34567	John	Doe	1996-07-09	Bowser	Final Destination
3	p002	coolDude5	IamCool	Josh	Smith	1995-12-11	Link	Battlefied
4	p003	jamesGriff	IamAnicePerson	James	Griffin	1995-06-09	Marth	Dream Land
5	p884	Alan887	alpaca	Alan	Labouseur	1986-01-03	Kirby	Battlefield

### **Characters Table:**

Represents all the different characters in the game.

### **Functional Dependencies**

cid —> name, description, class, origin

### **Sample Data**

	cid character(4)	cname text	cdescription text	class text	corigin text
1	c000	Pikachu	Down B	lightweight	pokemon
2	c001	Marth	Uses a sword	middleweight	fire emblem
3	c002	Bowser	Is a big dude	heavyweight	Mario
4	c003	Link	Has a lot of items	middleweight	Zelda
5	c004	Ness	swings a bat	lightweight	Earth Bound

### **Player\_Character Table:**

Since many players can be many different characters we need an associative table between the Players and Character table.

```
--Player_Character Table--
CREATE TABLE Player_Character (
   pid CHAR(4) NOT NULL REFERENCES Players(pid),
   cid CHAR(4) NOT NULL REFERENCES Characters(cid),
   PRIMARY KEY(pid, cid)
);
```

	pid character(4)	cid character(4)
1	p000	c000
2	p001	c002
3	p000	c002
4	p002	c003
5	p003	c001
6	p004	c004
	•	

### **Match Table:**

Stores all the information about each match played.

```
--Match Table--
Create table Match (
               CHAR(4) UNIQUE NOT NULL,
  matchID
  DATE
                               NOT NULL.
                 DATE
  time
               INTEGER,
                              NOT NULL,
               TEXT
  type
  stockLives
               INTEGER,
  numOfPlayers INTEGER
                               NOT NULL,
  sid
               CHAR(4) UNIQUE NOT NULL REFERENCES
Stages(sid),
  CHECK (time > 0),
  CHECK(stockLives > 0),
  CHECK(numOfPlayers >= 2),
 PRIMARY KEY(matchID,sid)
);
```

### **Functional dependencies**

matchID,sid —> date, time, type, stockLives, numOfPlayers

	matchid character(4)	date date	time integer	type text	stocklives integer	numofplayers integer	sid character(4)
1	m000	2016-01-02	100	Stock	2	2	s000
2	m001	2016-01-02	200	Stock	2	2	s001
3	m002	2016-01-02	300	Stock	2	2	s002
4	m003	2016-01-02	400	Stock	2	2	s003
5	m004	2016-01-09	340	Stock	6	8	s004

### Player\_Match Table:

The associative table between the Players and Match table. This table is necessary because there is a many to many relationship between the Players and Match tables.

	pid character(4)	matchid character(4)
1	p000	m000
2	p001	m001
3	p002	m002
4	p003	m003
5	p004	m004

### **Character Match Table:**

The associative table between the Character and Match tables. Many characters can play many matches.

```
--Character_Match Table--
CREATE TABLE Character_Match (
    cid CHAR(4) NOT NULL REFERENCES Characters(cid),
    matchID CHAR(4) NOT NULL REFERENCES
Match(matchID),
    Primary key(cid, matchID)
);
```

	cid character(4)	matchid character(4)
1	c000	m000
2	c001	m001
3	c002	m002
4	c003	m003
5	c004	m004

### **Tier Table:**

In the world of professional smash there are tiers to represent how good a character is. There are 3 tiers that each have their own level.

```
--Tier Table--
CREATE TABLE Tier (
    name TEXT NOT NULL,
    level TEXT NOT NULL,
    cid CHAR(4) NOT NULL REFERENCES Characters(cid),
    PRIMARY KEY(name, cid)
);
```

### **Functional Dependencies**

name,level -> cid

	tname text		cid character(4)
1	Tier 1	В	c000
2	Tier 2	Α	c001
3	Tier 3	Α	c002
4	Tier 1	Α	c003
5	Tier 1	B+	c004
_			

### **Moves Table:**

Each character has their own set of moves. This table stores each move and what character the move belongs to along with some more information about the move.

```
--Moves Table--
CREATE TABLE Moves (
   moveID CHAR(4) UNIQUE NOT NULL,
   cid CHAR(4) NOT NULL REFERENCES Characters(cid),
   name TEXT NOT NULL,
   damage INTEGER,
   CHECK(damage > 0),
   Primary key(moveID, cid)
);
```

### **Functional Dependencies**

moveID, cid -> name, damage

	moveid character(4)	cid character(4)	mname text	damage integer
1	m000	c000	down B	10
2	m001	c001	B Special	15
3	m002	c002	neutral B	7
4	m003	c003	Side smash	12
5	m004	c004	Side smash	20

### **Items Table:**

This table represents all the different items in a match. Not every match has items depending on the settings.

### **Functional Dependencies**

itemID, matchID —> name, description, damageGiven

	itemid character(4)	iname text	idescription text	damagegiven integer	matchid character(4)
1	i000	bat	one hit KO	250	m000
2	i001	bomb	blows stuff up	10	m001
3	i002	gun	shoots stuff	5	m002
4	i003	mine	explodes when activated	20	m003
5	i004	Mr. Saturn	hurts	25	m004

### **Stages Table:**

The table that represents all the different stages. It has a one to one relationship with the matches table because there is only one stage per match.

### **Functional Dependencies**

sid —> name, description, origin, song

	sid character(4)	sname text	sdescription text	sorigin text	song text
1	s000	Final Destination	Good stage	some place	a song
2	s001	Dream Land	nice stage	a place	dream song
3	s002	Battlefield	a good stage	a nice place	a good song
4	s003	Donkey Kong Land	big stage	a place	kong song
5	s004	Temple	large stage	zelda	zelda song

### **RegStage Table:**

A stage can be either a regular stage with special effects or an Omega Stage (with no special effects). This table represents the regular stages.

```
--RegStage Table--
CREATE TABLE RegStage (
    sid CHAR(4) NOT NULL REFERENCES Stages(sid),
    size INTEGER NOT NULL,
    CHECK (size > 0),
    PRIMARY KEY(sid)
);
```

### **Functional Dependencies**

sid -> size

	sid character(4)	size integer
1	s001	8
2	s002	15

### **OmegaStage Table:**

Represents the stages that are only omega. So their size is just the default size (different size from the regular stage)

### **Functional Dependencies**

sid -> defaultSize

	sid character(4)	defaultsize integer
1	s000	10
2	s002	12
3	s003	8
4	s004	8

### **Special Effects Table:**

Each stage has its own special effects and this table stores all the information about the special effect.

```
--Special Effects Table--
CREATE TABLE specialEffects (
    eID CHAR(4) UNIQUE NOT NULL,
    sid CHAR(4) NOT NULL REFERENCES Stages(sid),
    name TEXT,
    description TEXT,
    damage INTEGER,
    CHECK (damage > 0),
    PRIMARY KEY(eID, sid)
);
```

### **Functional Dependencies**

eID, sid —> name, description, damage

	eid character(4)	sid character(4)		sedescription text	damage integer
1	e000	s001	wind	wind	1
2	e001	s003	bombs	blow stuff up	10

# **Views**

### **Player Character View:**

A view into the Players and Characters tables. This is useful so we can see what players play as what characters.

create view PlayerCharacter as select Characters.\*, userName, firstName, favCharacter from Players, Characters, Player\_Character where Players.pid = Player\_Character.pid and Characters.cid = Player\_Character.cid

	cid character(4)	cname text	cdescription text	class text	corigin text	username text	firstname text	favcharacter text
1	c000	Pikachu	Down B	lightweight	pokemon	FrankBond007	Frank	Pikachu
2	c002	Bowser	Is a big dude	heavyweight	Mario	baseballDude	John	Bowser
3	c002	Bowser	Is a big dude	heavyweight	Mario	FrankBond007	Frank	Pikachu
4	c003	Link	Has a lot of items	middleweight	Zelda	coolDude5	Josh	Link
5	c001	Marth	Uses a sword	middleweight	fire emblem	jamesGriff	James	Marth
6	c004	Ness	swings a bat	lightweight	Earth Bound	Alan007	Alan	Kirby

### Match View (without items):

A look into the match without items

create view matchView as select m.matchID, m.date, m.time, m.type, m.stockLives, m.numOfPlayers,

s.sid, s.sName, s.sOrigin, s.song, c.cName, p.firstName from match m, Stages s, Characters c, Character\_Match cm, Players p, Player\_Match pm where m.sid = s.sid and c.cid = cm.cid and cm.matchID = m.matchID and p.pid = pm.pid and pm.matchID = m.matchID

	matchid character(4)	date date	time integer	type text	stocklives integer	numofplayers integer	sid character(4)	sname text	sorigin text	song text	cname text	firstname text
1	m000	2016-01-02	100	Stock	2	2	s000	Final Destination	some place	a song	Pikachu	Frank
2	m201	2016-01-02	200	Stock	2	2	s001	Oream Land	a place	dream song	Marth	John
3	m002	2016-01-02	300	Stock	2	2	s882	Bottlefield	a nice place	a good song	Bowser	Josh
4	m003	2016-01-02	400	Stock	2	2	s883	Donkey Kong Land	a place	kong song	Link	James
5	m004	2016-01-09	340	Stock	6	8	s884	Temple	zelda	zelda song	Ness	Alon

### Match View (with items):

A look into the match with items

create view matchViewItems as select m.matchID, m.date, m.time, m.type, m.stockLives, m.numOfPlayers, s.sid, s.sName, s.sOrigin, s.song, c.cName, p.firstName, i.itemID, i.iName, i.damageGiven from match m, stages s, Characters c, Character\_Match cm, Players p, Player\_Match pm, Items i where m.sid = s.sid and c.cid = cm.cid and cm.matchID = m.matchID and p.pid = pm.pid and pm.matchID = m.matchID and i.matchID = m.matchID and i.matchID = m.matchID

	matchid character(4)	date date	time integer	type text	stocklives integer	numofplayers integer	sid character(4)	sname text	sorigin text	song text	cname text	firstname text	itemid character(4)	iname text	damagegiven integer
1	m000	2016-01-02	100	Stock	2	2	s000	Final Destination	some place	a song	Pikachu	Frank	1000	bot	250
2	m001	2016-01-02	200	Stock	2	2	s001	Dream Land	a place	dream song	Marth	John	1001	bomb	10
3	m002	2016-01-02	300	Stock	2	2	S882	Battlefield	a nice place	a good song	Bowser	Josh	1002	gun	5
4	m003	2016-01-02	400	Stock	2	2	s003	Donkey Kong Land	a place	kong song	Link	James	1003	mine	20
5	m004	2016-01-09	340	Stock	6	8	s884	Temple	zelda	zelda song	Ness	Alon	1004	Mr. Saturn	25

### **Database View:**

A view into almost the entire database.

```
create view dbView as
select p.pid, p.firstName, p.lastName, p.dob, p.favCharacter,
p.favStage,
    m.matchID, m.date, m.time, m.type, m.stockLives,
m.numOfPlayers,
    S.*, C.*,
    i.itemID, i.iName, i.iDescription, i.damageGiven,
    t.tName, t.level,
    mo.moveID, mo.mName, mo.damage
from Players p, Match m, Player_Match pm, Stages s, Characters
c, Player_Character pc, Character_Match cm,
   Items i, Tier t, Moves mo
where p.pid = pm.pid
 and pm.matchID = m.matchID
 and m.sid = s.sid
 and c.cid = cm.cid
 and p.pid = pc.pid
 and c.cid = pc.cid
 and c.cid = cm.cid
 and i.matchID = m.matchID
 and t.cid = c.cid
 and mo.cid = c.cid
```

	pld character(4)		text	date	faveharacter text	THE PERSON NAMED IN COLUMN 1	matchid character(4)	date date	integer	text	integer	integer	character(4)	DENT .	text	text

# **Queries and Reports**

### **Character with the Strongest Move:**

Returns the character who has the strongest move.

select c.cid, c.cName, mo.mName, mo.damage as highestDamage from Characters c, Moves mo where c.cid = mo.cid order by mo.damage desc limit 1;

	cid character(4)		mname text	highestdamage integer
1	c004	Ness	Side smash	20

### Player who uses the Strongest Move:

Returns the player who uses the character with the strongest move.

```
select p.pid, p.firstName, c.cid, c.cName, mo.mName, mo.damage from Characters c, Players p, Player_Character pc, Moves mo where p.pid = pc.pid and pc.cid = c.cid and c.cid = mo.cid order by mo.damage desc limit 1;
```

### **Sample Output**

	pid character(4)	firstname text	cid character(4)		mname text	damage integer
1	p004	Alan	c004	Ness	Side smash	20

### **Special Effect with Players and Characters:**

Returns the players and characters (they played with) on a stage with special effects.

```
select p.firstName, c.cName, s.sName, se.seName, se.damage from Players p, Characters c, Stages s, specialEffects se, Match m, Player_Match pm, Character_Match cm where se.sid = s.sid and s.sid = m.sid and m.matchID = cm.matchID and c.cid = cm.cid and p.pid = pm.pid and pm.matchID = m.matchID
```

	firstname text	cname text	sname text	sename text	damage integer
1	John	Marth	Dream Land	wind	1
2	James	Link	Donkey Kong Land	bombs	10

# **Stored Procedures**

### **Player Stage:**

Returns the players who have played on the passed in stage.

```
create or replace function playerStage(text, REFCURSOR)
returns REFCURSOR as
$$
declare
 stage
       text := $1;
 resultSet REFCURSOR := $2;
begin
 open resultSet for
  select p.pid, p.firstName, p.lastName
  from Players p, Player_Match pm, Stages s, Match m
  where p.pid = pm.pid
   and pm.matchID = m.matchID
   and m.sid = s.sid
   and s.sName = stage;
 return resultSet;
end;
$$
language plpgsql;
```

	pid	firstname	lastname
	character(4)	text	text
1	p000	Frank	Siderio

### **Player Character Stage:**

Returns the players and characters who have played on the passed in stage.

```
create or replace function playerCharacterStage(text,
REFCURSOR) returns REFCURSOR as
$$
declare
 stage text := $1;
 resultSet REFCURSOR := $2;
begin
 open resultSet for
 select p.pid, p.userName, c.cid, c.cName
 from Players p, Characters c, Player_Match pm,
Character_Match cm, Match m, Stages s
 where p.pid = pm.pid
  and pm.matchID = m.matchID
  and c.cid = cm.cid
  and cm.matchID = m.matchID
  and m.sid = s.sid
  and s.sName = stage;
 return resultSet;
end;
$$
language plpgsql;
```

	pid character(4)	username text	cid character(4)	cname text
1	p000	FrankBond007	c000	Pikachu

### **Character Moves:**

Returns all the moves for the passed in character.

```
create or replace function characterMoves(text, REFCURSOR)
returns REFCURSOR as
$$
declare
 character text := $1;
 resultSet REFCURSOR := $2;
begin
 open resultSet for
 select c.cName, mo.moveID, mo.mName, mo.damage, c.cid
 from Moves mo, Characters c
 where c.cid = mo.cid
  and c.cName = character;
 return resultSet;
end;
$$
language plpgsql;
```

	cname text	moveid character(4)		damage integer	cid character(4)
1	Pikachu	m000	down B	10	c000

### **Add Player Trigger**

```
create or replace function addPlayer() returns trigger as
$$
   begin
    if NEW.pid is null then
      raise exception 'Invalid pid';
    end if:
    if NEW.userName is null then
      raise exception 'Invalid userName';
    end if;
    if NEW.password is null then
      raise exception 'Invalid password';
    end if;
    insert into Players(pid, userName, password, firstName,
lastName, dob, favCharacter, favStage)
            values (NEW.pid, NEW.userName, NEW.password,
NEW.firstName, NEW.lastName, NEW.dob, NEW.favCharacter,
NEW.favStage);
    return new;
   end:
$$ language plpgsql;
Trigger
create trigger addPlayer
after insert on Players
for each row execute procedure addPlayer();
```

# **Security**

With this database there is only a need for two different roles (an admin and a player). An admin has access to whatever he/she wants to do. A player only has access to view anything in the database.

create role db\_admin grant select, insert, update, delete on all tables in schema public to db\_admin

create role player grant select on Players, Stages, OmegaStage, RegStage, specialEffects, Match, Characters, Moves, Tier, Items to player

# Implementation Notes, Known Problems Future Enhancements

The implementation went well with not too many issues. This database is useful for generating reports and statistics about the game. It could be used for analyzing Players behavior to learn more about them to then make the game better.

There aren't any big issues in this design. Even though the database covers almost the entirety of the game it could be much more complex. For example, not all Items give damage there're some items that give health. If I wanted to enhance this database in the future that is something I could easily add. Also, the Moves table could be more complex. Not every move is the same. Some moves are projectiles and some do not give damage and can actually receive other projectiles and shoot them back out. With this design it allows for future implementations for the full game.
